

# Whole and Part Practice

KIN 377 Motor Learning - Spring 2024 @ CSUN

Ovande Furtado Jr

2024-04-15

## Credits

This presentation is based on the book by Magill & Anderson (2020).

## Learning Objectives

- Define the terms \_\_\_\_\_ and \_\_\_\_\_ as they relate to the relationships among the parts or components of a complex motor skill.
- Describe ways to apply the part-practice methods of \_\_\_\_\_ and \_\_\_\_\_ to the practice of motor skills.
- Describe several ways to apply \_\_\_\_\_ methods to the practice of motor skills.

## Definitions

- **Whole practice**
  - A practice strategy that involves practicing a skill \_\_\_\_\_ (i.e., as a whole)
- **Part practice**
  - A practice strategy that involves practicing \_\_\_\_\_ of a skill before practicing the whole skill

# Whole or Parts Practice

## Complexity vs. Organization

The decision to practice a skill as a whole or in parts can be based on the \_\_\_\_\_ and \_\_\_\_\_ characteristics of the skill (Naylor & Briggs, 1963).

- **Complexity:** \_\_\_\_\_ of parts or components and the degree of \_\_\_\_\_ that characterize a skill.
  - More complex tasks have \_\_\_\_\_ component parts and place more demands on \_\_\_\_\_.
  - Note: “Complexity” is distinct from “\_\_\_\_\_.”
- **Organization:** The \_\_\_\_\_ among the component parts of the skill.
  - Skill has a high level of organization when its component parts are \_\_\_\_\_ and \_\_\_\_\_ interdependent.
    - \* Example: \_\_\_\_\_.
  - Low level of organization: When the component parts are \_\_\_\_\_ independent.
    - \* Example: \_\_\_\_\_.

## How to decide whether to use Whole or Part practice?

- Must \_\_\_\_\_ the skill
- According to Naylor and Briggs (1963), focus on:
  - \_\_\_\_\_
  - the extent to which the spatial-temporal characteristics are \_\_\_\_\_
  - decide which levels of \_\_\_\_\_ and \_\_\_\_\_ best represent the skill

## Example: Juggling

*(Image of juggling)*

## Decisions to Use Whole or Part Practice

Assessing the levels of \_\_\_\_\_ and \_\_\_\_\_ of a skill.

- If the skill is \_\_\_\_\_ in \_\_\_\_\_ and \_\_\_\_\_ in \_\_\_\_\_, practice the \_\_\_\_\_ skill.
- If the skill is \_\_\_\_\_ in \_\_\_\_\_ and \_\_\_\_\_ in \_\_\_\_\_, practice by using the \_\_\_\_\_ method.

### Example: beam routine in gymnastics

	Low Organization	High Organization
Low Complexity		
High Complexity		

Organization: The \_\_\_\_\_ among the component parts of the skill.

Complexity: \_\_\_\_\_ of parts or components and the degree of \_\_\_\_\_ that characterize a skill.

Rule of thumb

- If High in \_\_\_\_\_ -> one must use \_\_\_\_\_ because the parts are interconnected; else, either approach is ok.
- If High in \_\_\_\_\_ -> one must use \_\_\_\_\_ because the parts are interconnected; else, either approach is ok.
- How would you practice a *balance beam routine* in gymnastics?
- Is the **Organization** High or Low
- Is the **Complexity** High or Low
- Answer: \_\_\_\_\_ and \_\_\_\_\_ -> \_\_\_\_\_ is the most effective

### Example: Baseball pitching

	Low Organization	High Organization
Low Complexity		
High Complexity		

Organization: The \_\_\_\_\_ among the component parts of the skill.

Complexity: \_\_\_\_\_ of parts or components and the degree of \_\_\_\_\_ that characterize a skill.

Rule of thumb

- If High in Organization -> one must use \_\_\_\_\_ because the parts are interconnected; else, either approach is ok.
- If High in Complexity -> one must use \_\_\_\_\_ because the parts are interconnected; else, either approach is ok.
- How would you practice *baseball pitching*?
- Is the **Organization** High or Low
- Is the **Complexity** High or Low
- Answer: \_\_\_\_\_ and \_\_\_\_\_ -> \_\_\_\_\_ is the most effective

## Part Practice

Fractionization | Segmentation | Simplification

### Fractionization - Intro

- Method
  - Fractionization is a part-practice strategy for skills requiring \_\_\_\_\_ (AC).
    - \* What is AC?
      - Tasks that demand \_\_\_\_\_ movements from each limb (arm or hand) simultaneously.
- Does it matter which limb to practice first?
  - The \_\_\_\_\_ of individual limb movements determines the order of practice.
    - \* Sherwood (1994) suggests starting with the \_\_\_\_\_ limb.
  - Fractionization is supported as an effective strategy for asymmetric skills (Walter & Swinnen, 1994).

### Fractionization - Examples

Musical instruments like the \_\_\_\_\_ or sports skills like the \_\_\_\_\_.

## Segmentation - Intro

Although helpful, part-practice can be a problem when performer needs to put the part back together with the whole skill.

- Method
  - Start with practicing the \_\_\_\_\_, then progressively integrate additional parts, culminating in the whole skill.
  - The progression should ideally move from \_\_\_\_\_ to \_\_\_\_\_, optimizing learning outcomes.
- Overcoming Integration Challenges
  - Problem: Difficulty arises when trying to \_\_\_\_\_ separate parts of a skill learned in isolation.
  - Solution: \_\_\_\_\_ part practice reinforces the connection between parts as the learner advances.

## Segmentation - Advantages

- Allows \_\_\_\_\_ on individual parts, easing the cognitive load.
- Mitigates difficulties in \_\_\_\_\_ learned parts into a whole skill.
- Ideal for skills involving \_\_\_\_\_ of movements.
- Facilitates \_\_\_\_\_ and \_\_\_\_\_ coordination as parts are integrated.
- Combines the attentional benefits of \_\_\_\_\_ with the integrative advantages of \_\_\_\_\_.
- The learner progressively masters the coordination of parts while managing the \_\_\_\_\_ of the whole skill.

## Segmentation - Examples

*(Image of breaststroke)*

- The breaststroke
  - It can be divided into \_\_\_\_\_ and \_\_\_\_\_.
  - Each part is learned separately before integrating them, focusing on \_\_\_\_\_ timing.
- Empirical Support for Segmentation
  - Watters (1992): Demonstrated benefits for \_\_\_\_\_ on a keyboard.
  - Ash and Holding (1990): Showed advantages for learning a \_\_\_\_\_.

## Simplification - Intro

- Definition: Simplification involves \_\_\_\_\_ a skill or its components to make it easier to perform.
- Aimed at helping learners grasp \_\_\_\_\_ skills by reducing difficulty.
- Strategies: Several methods can be used, each tailored to \_\_\_\_\_ types of skills.

### 1. Reducing Object Difficulty

*(Image of juggling with bean bags)*

- Technique: Use \_\_\_\_\_ objects to reduce task complexity.
- Example: Learning to juggle with \_\_\_\_\_ instead of balls to slow the movement.
- Research Support: Early practice with simpler objects aids in grasping the \_\_\_\_\_ (Hautala, 1988).

### 2. Reducing Attention Demands

*(Image of skiing with poles)*

- Strategy: Minimize the \_\_\_\_\_ by reducing the complexity of the task.
- Example: Using \_\_\_\_\_ while learning to slalom improves focus on movement coordination (Wulf et al., 1998; Wulf & Toole, 1999).
- Application: Body-weight support systems in gait rehabilitation reduce the cognitive load of \_\_\_\_\_ (Miller, Quinn, & Seddon, 2002).

### 3. Reducing Speed

- Purpose: \_\_\_\_\_ practice to emphasize the timing and spatial aspects of a skill.
- Benefit: Establishes essential \_\_\_\_\_ patterns that can be transferred to normal speeds.
- Evidence: Effective for learning both \_\_\_\_\_ and \_\_\_\_\_ (Walter & Swinnen, 1992).

## 4. Adding Auditory Cues

*(Image related to auditory cues)*

- Method: Incorporate \_\_\_\_\_ signals to guide the performance of skills.
- Success: Assists in improving gait in \_\_\_\_\_ patients (Thaut et al., 1996).
- Broader Application: Auditory cues aid various \_\_\_\_\_ and enhance motor rehabilitation (Rochester et al., 2009; White et al., 2009; Malcolm, Massie, & Thaut, 2009).

## 5. Sequencing Skill Progressions

- Approach: Gradually \_\_\_\_\_ the complexity of tasks in a sequenced manner.
- Example: Baseball players progressing from hitting off a \_\_\_\_\_ to hitting a pitched ball.
- Research: Shows benefits for learning \_\_\_\_\_ and increased \_\_\_\_\_ (Hebert, Landin, & Solmon, 2000; Stevens et al., 2012).

## 6. Simulators and Virtual Reality

*(Image related to simulators or VR)*

- Advantages: Allows practice without \_\_\_\_\_ consequences and offers control over specific conditions.
- Examples: Diverse applications across \_\_\_\_\_, \_\_\_\_\_, \_\_\_\_\_, and \_\_\_\_\_ training.
- Effectiveness: Generally supported by research when similar to the \_\_\_\_\_ environment (Fisher et al., 2002; Howells et al., 2008).

## Other Approaches

### Part Practice in Whole Practice

Problem: When a skill should not be taught using part-practice but some aspects are important to focus.

Solution: Application: Directing attention to a specific part of a skill during its performance.

- Premise: It's possible to focus on \_\_\_\_\_ of a skill during whole practice to improve specific aspects.

- Advantage: Merges the benefits of both \_\_\_\_\_ and \_\_\_\_\_ practice strategies for skill development.

### **Theoretical Support for the Attention Approach**

- Attention Theory: Kahneman's model highlights ' \_\_\_\_\_ ' as a key to allocating attention.

Momentary intentions - the conscious, voluntary decisions about where to focus attention at a given moment. Kahneman's model proposes that these momentary intentions are a central factor in the allocation of attention

### **Empirical Evidence of Attention-Directing Strategy**

- Study: Gopher, Weil, and Siegel (1989) on learning the \_\_\_\_\_
- Findings: Directing attention to specific \_\_\_\_\_ of the game improved mastery.

### **Implementation of Attention-Directing Strategy**

- Instructions focused on specific skill components, e.g., \_\_\_\_\_ the spaceship or \_\_\_\_\_ mines.
- The dual-strategy group (controlling spaceship first, then handling mines) \_\_\_\_\_ other groups.

### **Teaching Implications**

- Before deciding whether to practice a skill as a whole or by parts, \_\_\_\_\_ the skill to identify its component parts.
- After analyzing a skill and identifying its parts, determine the degree to which the performance of any one part \_\_\_\_\_ on the performance of the preceding part. When parts are characterized with this relationship, the parts should be practiced \_\_\_\_\_ rather than as separate parts.
- It is important not to assume that because parts can be \_\_\_\_\_, they should be practiced separately; the performance dependence on preceding and following parts should always \_\_\_\_\_ the decision concerning which parts to practice separately and which parts to practice together.

- When the parts of a skill follow a specific \_\_\_\_\_ of movements, the preferred way to engage in part practice is the \_\_\_\_\_ part method, in which parts are practiced in sequence and become increasingly larger until the whole skill can be practiced in its entirety.
- When practicing the parts of a skill is not advisable or possible, consider ways to \_\_\_\_\_ the whole skill before engaging people in performing the skill as it would be performed in its real-world context.
- When the technology is available, \_\_\_\_\_ and \_\_\_\_\_ provide excellent initial means of engaging people in practicing a skill before having them practice it as it would be performed in its real-world context.
- Directing attention to a part of a skill while performing the whole skill can be an effective way to \_\_\_\_\_ errors for parts of a skill that should not be practiced as separate parts.
